

GENERAL INFORMATION

Course information	
Name	Biomedical Electronics
Code	DEA-OPT-624
Degree	MII, MITL
Year	2º
Semester	2º / Spring
ECTS credits	3 ECTS
Type	Elective
Department	Electronics, Control Engineering and Communications
Area	Analog electronics
Coordinator	Romano Giannetti

Lecturer	
Name	Romano Giannetti
Department	Electronics, Control Engineering and Communications
Area	Analog Electronics
Office	D-209
e-mail	romano@comillas.edu
Phone	
Office hours	Arrange an appointment through email.

DETAILED INFORMATION

Contextualization of the course

Contribution to the professional profile of the degree

The course is aimed to provide to the students the basic knowledge required to undertake the study of electronic systems used in medical field, and the associated instrumentation.

When students have finished out the course, they will understand the basic principles governing the generation and emission of signals in and from the human body, the basics of safety regulations in designing biomedical systems and the techniques and electronic principles on which are based the instruments used in medical field. This will provide the ability to decide on the selection, purchase and installation of these systems in a hospital or clinic environment. Additionally, the student will have a foundation on which they can build up more knowledge in order to be able to participate in the design and implementation of biomedical systems.

Prerequisites

The prerequisites that students must have to fruitfully follow the course are the basic concepts of analog electronics: basic amplifiers and operational amplifiers, concept of signal and bias, frequency response, filter circuits, basic electromagnetic fields principles. In addition they should have a working knowledge of the mathematical methods used in the design and analysis of the above electronic systems: concepts of signals and their spectra, use of complex impedances, frequency analysis of circuits.

CONTENTS

Contents
Part 1: Theoretical fundamentals
Section 1: INTRODUCTION
1.1 Historical introduction; the evolution of medical instrumentation. 1.2 Physiology of signals produced by the human body. 1.3 Body - Electromagnetic field interaction.
Section 2: ELECTRONIC SYSTEMS
2.1 Instrumentation and differential amplifiers. 2.2 Digital instrumentation: analog-to-digital conversion and back. 2.3 Noise and extraneous signals pick-up; analysis and countermeasures. 2.4 Electrodes and examples of biomedical sensor.
Section 3: SAFETY AND PROTECTIONS
2.1 Safety in biomedical instrumentation; classes of instruments. 2.2 Insulation amplifier. 2.3 Circuit breakers and safety systems. 2.4 Uninterrupted power supply systems.

Part 2: APPLICATIONS
Section 4: DETAILS ON SPECIFIC INSTRUMENTATION – a student-select subset of the following:
4.1 Electrocardiography. 4.2 Ultrasonography. 4.3 Biomaterials and biomechanics. 4.4 Cardiac assistance systems. 4.5 Electroencephalography 4.6 NMR (nuclear magnetic resonance). 4.7 Tomography. 4.8 Other systems proposed by the students

Competences and Learning Outcomes

Competences

General Competences

- CG3. The capability of adapting to new theories, methods and changing engineering situations based on a sound technical training.
- CG4. The capability of solving problems with personal initiative, efficient decision making, critical reasoning and transmitting technical information in the engineering world.
- CG5. The capability of conducting measurements, calculations, assessments, studies, reports, planning, etc.
- CG10. The ability to work in a multilingual and multidisciplinary environment.

Basic Competences

Specific Competences

Learning outcomes

- RA1. The student understands how electrical signals are generated in the human body, and how to pick them up.
- RA2. The student has a basic knowledge of the sensors used to translate biological quantities in electrical signals.
- RA3. The student is able to assess the effect that a current can have on the body given its characteristics (intensity, frequency, duration).
- RA4. The student knows the risks associated with the electrical stimulation of body tissues.
- RA5. The student understands the concept of differential/instrumentation amplifier, and is able to apply that knowledge both in analyzing a given circuit and to find out the characteristics of the amplifier given the specific problem.
- RA6. The student understands the concept of Digital to Analog conversion, its feature and limitation, and understands the meaning of the related parameters (bits, dynamic range, linearity, quantization noise, etc.).
- RA7. The student understands the concept of noise and interference pick-up, and is able to calculate the effect of noise in an electronic system.
- RA8. The student has a basic knowledge of the safety norms in biomedical instrumentation design, and their application.
- RA9. The student knows the design solutions oriented toward safety, such as insulation amplifiers, breakers, safety alarms and uninterrupted supply systems.
- RA10. The student is able to find information about a biomedical instrument, analyze and understand it, and explain its working principles to the other students.

TEACHING METHODOLOGY

General methodological aspects

The course will be divided in two parts, partly overlapping in time. The teacher will explain the basics of the subject and will go in depth in the more important issues, proposing exercises and quizzes for the student to solve in class in a collaborative way. After the first third of the course is completed, the students will form groups and each one will research a specific application, which will present to the rest of the class in the last third of the course.

In-class activities

- 1.- **Expository lesson (11h):** The instructor will explain the fundamental concepts, stressing the most important issues. At all time an active participation will be required to the student, by asking questions, posing problems, and stimulating open discussion.
- 2.- **Problem-solving sessions (4h):** The professor will propose a problem, and the students, organized in small informal groups, will solve it under the instructor's supervision.
- 3.- **Supervised group work (6h):** The students, organized in groups, will research and study a specific biomedical instrument under the lecturer's supervision, and prepare a presentation for the rest of the class.
- 4.- **Presentations (4h):** the students, organized in groups, will explain to the rest of the class the working of a specific biomedical instrumentation system.
- 5.- **Tutoring (3h):** review sessions and additional tutoring, which will be organized when needed, on a per-group and/or per-student base.
- 6.- **Evaluation (2h):** quizzes and one mid-term exam.

Off-class activities

At-home work will be focused on the objective to learn to solve problems oriented to biomedical instrumentation systems design and to learn to understand complex system and prepare to explain them to other people.

So the main at-home activities will be:

- 1.- Personal, individual study of the course materials and books. (44h)
- 2.- Research about medical instrumentation using the proposed bibliography and other sources. (12h)
- 3.- Preparation of the presentations to explain the specific instrument chosen by the group. (4h)

ASSESSMENT AND GRADING CRITERIA

Assessment activities	Grading criteria	Share
Full tests: <ul style="list-style-type: none"> • Mid-term exam • Final exam 	<ul style="list-style-type: none"> - Check the full understanding of the theoretical concepts. - Problem-solving, applying the concepts. - Critical evaluation of the results of numerical exercises. - Written communication skills. 	60%
The grade on the final exam must be at least 4 (over 10) to pass the course.		
Bi-weekly (approx.) evaluation: <ul style="list-style-type: none"> • continuous evaluation quizzes: 	<ul style="list-style-type: none"> - Same as above, in small tests of 15 minutes or less. 	10%
Presentations: <ul style="list-style-type: none"> • Evaluation of the written material developed by the group • Evaluation of the quality of the oral presentation 	<ul style="list-style-type: none"> - Full understanding of the concept. - Skills in selecting the important part of the information - Summarizing and highlighting the main features of the systems. - Group work skills. - Oral presentation skills. 	30%
There will be an inter-group evaluation method to differentiate among members of the same group.		

GRADING AND COURSE RULES

Grading
Regular assessment
<p>In the ordinary assessment period, the final grade will be obtained as follow:</p> <ul style="list-style-type: none"> • 60% will be the exams grade (30% mid-term, 30% final). The grade on the final exam must be at least 4 (over 10) to pass the course, independently from the other marks. • 10% from the continuous evaluation quizzes. • 30% from the presentation. <p>In the extraordinary period, the final grade will be:</p> <ul style="list-style-type: none"> • 60% from the extraordinary (retake) exam grade, with a minimum mark of 4 (over 10). • 10% from the continuous evaluation quizzes. • 30% from the presentation.
Retakes
<p>In the extraordinary period, the final grade will be:</p> <ul style="list-style-type: none"> • 60% from the extraordinary (retake) exam grade, with a minimum mark of 4 (over 10). • 10% from the continuous evaluation quizzes. • 30% from the presentation.

Course rules

- Each test will check the totality of the course content to that point
- The lack of assistance throughout the course of over 15% of the teaching hours can cause the loss of the right for the student to take the exam in the ordinary session of the academic year (cf. **Artículo 93º: Escolaridad**, Reglamento General de la Universidad, Normas Académicas ETSI-ICAI)
- The student who commits an irregularity in any evaluable test will be graded Fail (0) on this test and a disciplinary procedure will be opened against him or her (cf. **Artículo 168º. Infracciones y sanciones del alumnado**, Reglamento General de la Universidad).
- During the tests, generally, the use of books and notes is forbidden. In most tests, the use of a calculator and a one-page cheat-sheet will be allowed (check with the instructor).

WORK PLAN AND SCHEDULE¹

Off-class activities	When?	Date due
• Read and study the day's subject	After each lesson	
• Review the solution of the proposed problems and quizzes	Bi-weekly (approx).	
• Analysis and selection of the subject for the group presentation	Week 5	Week 6
• Personal study for the mid-term and final exams	Week 7 and 14.	
• Preparation of the presentation material (PDF/PPT presentation, hand-out, summary)	Week 10 to 14	One day before the presentation

STUDENT WORK TIME SUMMARY			
IN_CLASS HOURS			
Expository lesson	Supervised Group work	Presentations / tutoring	Evaluation
11	10	7	2
OFF_CLASS HOURS			
Personal study	Research about biomedical systems	Group work: preparation of the presentations	
44	12	4	
CRÉDITOS ECTS:			3 (90 horas)
