

FICHA TÉCNICA DE LA ASIGNATURA

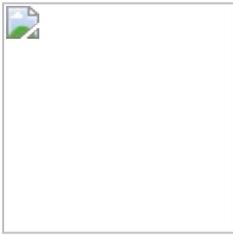

Datos de la asignatura	
Nombre completo	Biomecánica del daño// Injury Biomechanics
Código	DIM-M2S-514
Impartido en	Máster Universitario en Ingeniería Industrial + Máster en Ingeniería para la Movilidad y Seguridad [Segundo Curso]
Cuatrimestre	Semestral
Créditos	3,0 ECTS
Carácter	Obligatoria
Departamento / Área	Departamento de Ingeniería Mecánica
Responsable	Francisco José López Valdés

Datos del profesorado	
Profesor	
Nombre	Francisco José López Valdés
Departamento / Área	Departamento de Ingeniería Mecánica
Despacho	Alberto Aguilera 25 [D-317]
Correo electrónico	fjlvaldes@icai.comillas.edu

DATOS ESPECÍFICOS DE LA ASIGNATURA

Contextualización de la asignatura
Aportación al perfil profesional de la titulación
Injury biomechanics is the part of biomechanics that analyzes how external energy can damage tissue and characterizes the mechanical threshold to prevent injuries. Students will receive basic contents about anatomy and most frequent injuries occurring in relevant scenarios (i.e. vehicle collisions), complemented by the introduction to the biomechanical experiments that set the bases for existing injury criteria. The course will also cover some of the most advanced research in the protection of road users.
Prerequisitos
Knowledge of basic courses of materials science and strength of materials.

Competencias - Objetivos
Resultados de Aprendizaje
The student will learn the basis of the development of existing injury criteria and the characteristics of the

datasets in which they are based. This knowledge will allow him to develop a critical approach to how these criteria are currently used in the automotive industry.

BLOQUES TEMÁTICOS Y CONTENIDOS

Contenidos – Bloques Temáticos

1. Introduction to injury prevention
2. Introduction to human anatomy and anatomical terms
 - Review of anatomy of main body regions: head, spine, thorax, abdomen, upper extremity and lower extremity
3. Injury scales.
 - Injury scales, focus on AIS
4. Crash surrogates and related biomechanical experiments: volunteers, animals, Post Mortem Human Surrogates and human body models
5. Injury criteria
 - Statistical methods
 - Development of injury criteria
 - Examples of most relevant injury criteria used in automotive industry
6. Review of body regions and related injuries and biomechanical data
7. Challenges in injury biomechanics
 - Age effects
 - Sex effects
 - Anthropometry effects

METODOLOGÍA DOCENTE

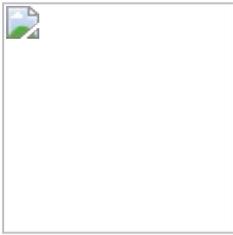

Aspectos metodológicos generales de la asignatura

85% in-person class teaching

Seminars discussing the content of the course

Article reviews

15% laboratory activities

Several bone samples will be exposed to tensile tests up to fracture. Students will have to develop an injury criterion for the fracture of bone, considering potential confounding factors

EVALUACIÓN Y CRITERIOS DE CALIFICACIÓN

Standard evaluation at the end of the term:

- 25% Lab project
- 15% Homework (provide dummy based measurements and asking for estimations of the risk of injury for different body regions)
- 10% Quiz/quizzes on reading materials provided by the instructor
- 10% Summary of one paper from 2020 AAAM Conference
- 40% Critique of a relevant published paper
- Attendance: minimum 85% to be allowed to be graded in January.

Additional evaluation during July (Retake):

- 20% Lab project
- 80% Critique of a relevant published paper
